

Project Executable Files

ComicCraft – AI Comic Story Creator using Gemini Models

ComicCraft is a web-based AI comic story creator developed using Python and FastAPI, with HTML, CSS and JavaScript for the user interface. The executable project is organized so that the application can be run locally and used to generate, preview and export comics.

Project Files and Folders

S.No	File / Folder	Purpose
1	app/main.py	Main FastAPI application entry point used to start the ComicCraft backend.
2	app/routes.py	Defines application routes and handles user requests.
3	app/schemas.py	Contains structured data models used for comic input and output.
4	app/services/gemini_service.py	Handles Gemini-based AI story and content generation.
5	app/services/image_generator.py	Handles generation of illustrations for comic panels.
6	app/services/layout_builder.py	Builds the panel layout and comic composition.
7	app/services/exporters.py	Handles comic export, including PDF generation.
8	templates/	Contains HTML templates used for the ComicCraft web interface.
9	static/	Contains CSS, JavaScript and generated/static media assets.
10	requirements.txt	Lists the Python dependencies required to run the project.
11	tests/test_app.py	Contains application tests for validating core functionality.

Execution Workflow

- Install the dependencies listed in requirements.txt.
- Configure the required environment variables locally.
- Start the FastAPI application using the project entry point.
- Open the ComicCraft web interface in a browser.
- Enter the story prompt and comic configuration details.
- Generate the comic, preview the panels and export the final PDF.

Expected Output

The executable project should provide a working ComicCraft interface where users can submit a story idea, generate structured comic content and panel illustrations, preview the result and export the completed comic as a PDF.
